POLYNEPHRON

Confidence From
The Inside Out

ELISIO™ POLYNEPHRON™: Confidence From The Inside Out

When Nipro set out to reimagine the single-use, high-flux, hollow-fiber dialyzer, our goal was to evolve the new ELISIO™ POLYNEPHRON™ into a product delivering multiple, valuable advantages.

Our design and engineering teams accomplished these objectives, innovating an array of powerful, practical features – including thousands of fibers in each membrane, with each fiber acting as a nephron. By utilizing a membrane that functions more like a human kidney, outstanding biocompatibility, hemocompatibility, and solute-removal performance is achieved, resulting in superior clearances for better patient outcomes.

Evolution of the Dialyzer

By combining more than 30 years of global experience in design and manufacture of dialyzers with extensive research and engineering innovation, Nipro created the ELISIO™ POLYNEPHRON™ Single Use, Hollow-Fiber Dialyzer. This state-of-the-art product evolves and advances our extensive fiber and dialyzer manufacturing expertise to your benefit. The result: state-of-the-art performance through a synthesis of a remarkable new membrane material and significant design improvements.

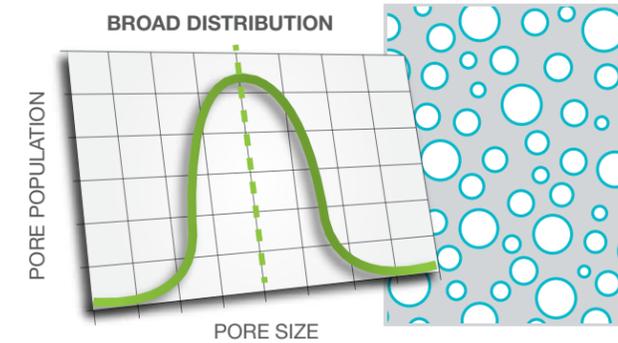

Together, the innovations and advantages Nipro has designed into ELISIO™ POLYNEPHRON™ deliver greater confidence to everyone involved in the dialysis process.

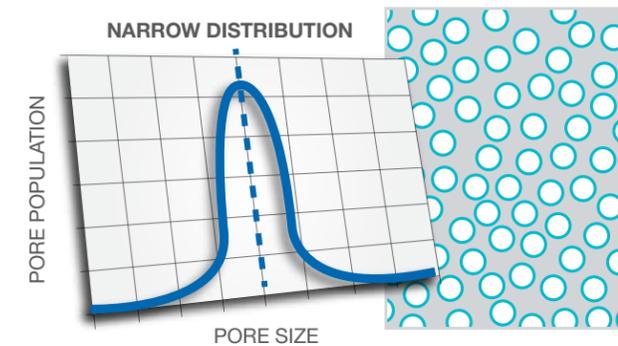

POLYNEPHRON™: State-of-the-Art Membrane

To function more like the human kidney, we built thousands of fibers into each ELISIO™ dialyzer – thus POLYNEPHRON™ – where every fiber acts as a nephron (human kidney element). This unique hollow-fiber formulation, developed by Nipro, features a one-of-a-kind, highly optimized structure to deliver outstanding biocompatibility, hemocompatibility, and solute-removal performance.

- Newly formulated PES (polyethersulfone) composition for more well-balanced membrane properties
- 3D chemical structure modeling with ideal mix of hydrophilic and hydrophobic domains reduces membrane fouling
- Advanced pore-spinning technology creates more homogenous pore sizes to optimize sieving properties
- Uniform pore size results in improved removal of uremic toxins and low-molecular-weight proteins, with limited loss of important proteins such as albumin
- Unique ripple structure inside dialyzer creates less dialysis channeling for more homogenous flow and better diffusive transport and enhanced small molecule clearances
- Improved mechanical fiber strength reduces risk of fiber leakage

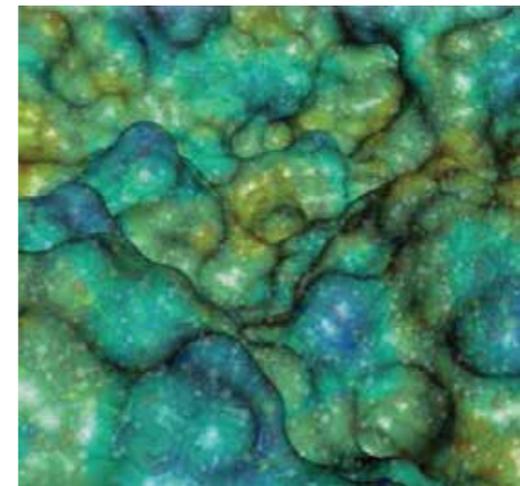

Non-uniform pore size and spacing on membrane surface provides reduced performance.

Optimized, highly uniform ELISIO™ POLYNEPHRON™ pore size and distribution offers far better performance. Note: Above charts are illustrative representations and are not based on actual data.

Thousands of fibers are built into every dialyzer. The 3D chemical structure modeling affords an ideal mixture of hydrophilic and hydrophobic domains.

Smarter and Safer Design

ELISIO™ advances the dialyzer design in terms of composition, removal performance and results. We start with lighter, polypropylene housing and headers, which do not contain BPA. The inner design – featuring an ultra-smooth polyurethane cut surface and finely finished inner lumen of hollow fibers – ensures smooth blood flow and minimizes potential blood cell damage.

Patient Performance

- Design enhancements optimize blood flow minimizing residual blood in the dialyzer
- Better contact between dialysate and blood compartments provides higher package density for superior performance
- Improved header shape with redesigned caps to optimize blood flow dynamics
- Ultra-smooth polyurethane cut surface on ELISIO™ dialyzer minimizes risk of blood cell damage during hemodialysis

Composition and Safety

- Housing and fibers are not made with BPA or DEHP thereby minimizing risk for endocrine disruption and safeguarding public health
- Header caps are permanently attached, eliminating unexpected removal or reuse
- Caps on blood and dialysate sides maintain aseptic technique during setup
- Packaging for the dialyzer is patented – it is packed in a foil bag that reduces degradation of membrane due to oxidation during gamma sterilization

Improved header shape with redesigned, permanent caps reduces channeling at the blood side while eliminating possibility of unexpected removal or reuse.

Ultra-smooth polyurethane cut surface on ELISIO™ dialyzer minimizes risk of blood cell damage during hemodialysis.

Greener, Easier to Handle, and More Cost Effective

Eco-friendliness

- 10% less CO₂ emission for resin production
- 50% less CO₂ emission when incinerated
- 25% less resin waste and 100°C lower temperature needed to mold polypropylene parts, compared to typical BPA-derived materials from other manufacturers
- Reduced energy consumption for transportation per product unit, due to lower weights and because about 50% more product can be loaded onto same-size vehicle

Handling and Savings

- 25% lighter than some competitors, making it easier to transport and handle safely
- Significant disposal cost savings

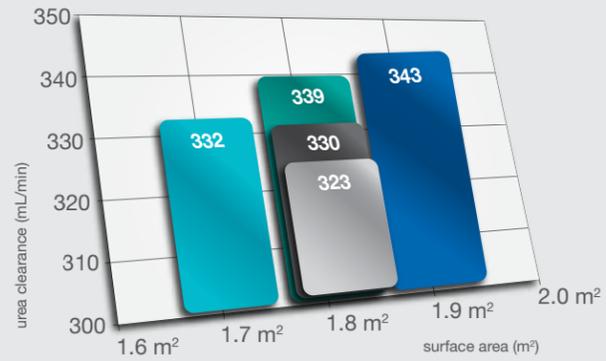

A greener materials selection offers an array of eco-advantages, thanks to extensive use of polypropylene instead of polycarbonate.

The ELISIO™-H Dialyzer Delivers Excellent Clearances

Superior In-Vitro Clearances

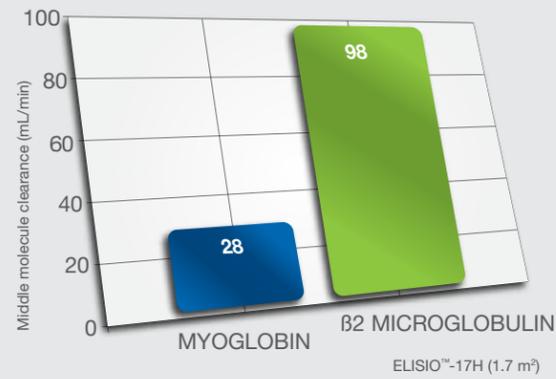

Testing demonstrates that the ELISIO™ POLYNEPHRON™ dialyzer provides higher clearances of small molecules.

Ob 400/Qd500/QfO Manufacturers' published data on file.

Excellent In-Vivo Clearances

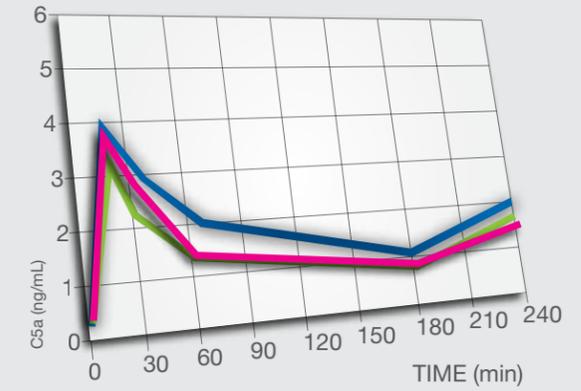

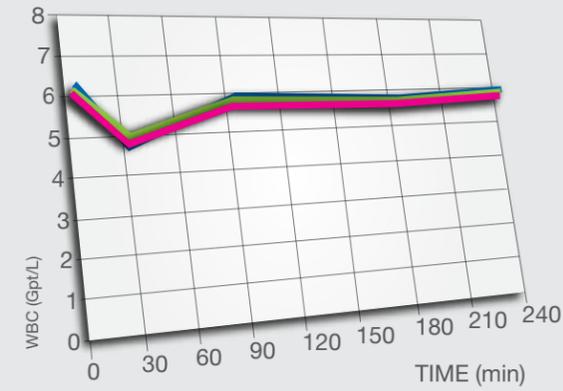

For middle molecule clearances, the ELISIO™-17H dialyzer demonstrated excellent performance with regard to β2 microglobulin and myoglobin.

Testing Conditions: Ob 300 mL/min; Qd 500 mL/min; 8 patients
Clinical data obtained in Germany, 8 patients, Feb-Mar 2010

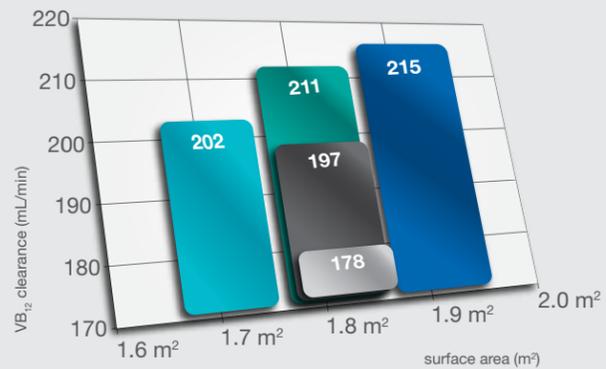

Exceptional Biocompatibility

The ELISIO™ POLYNEPHRON™ synthetic membrane exhibited excellent biocompatibility on WBC and C5a.

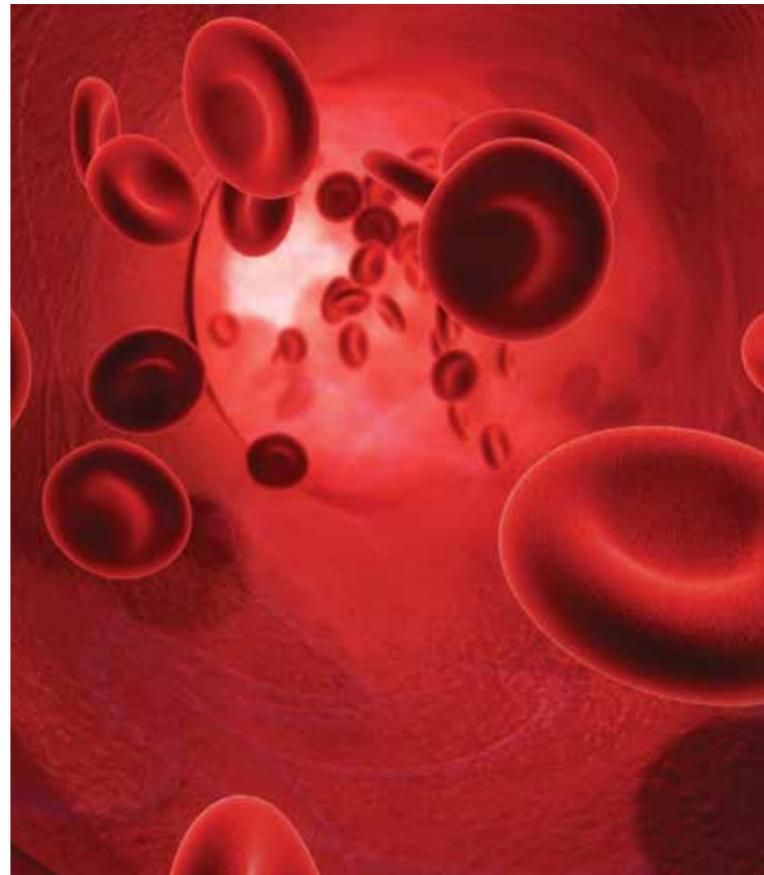

■ Polyarylethersulfone ■ POLYNEPHRON™ ■ Polysulfone
